Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

	Application No.	Applicant(s)				
Office Action Occurrence	10/542,837	VAN LEEST ET AL.				
Office Action Summary	Examiner	Art Unit				
	NANCY BITAR	2624				
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.  - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).						
Status						
1) Responsive to communication(s) filed on <u>15 Oc</u>	ctober 2008.					
	action is non-final.					
3) Since this application is in condition for allowar	Since this application is in condition for allowance except for formal matters, prosecution as to the merits is					
closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213.						
Disposition of Claims						
4)⊠ Claim(s) <u>1-10</u> is/are pending in the application.						
4a) Of the above claim(s) is/are withdrawn from consideration.						
5) Claim(s) is/are allowed.						
6)⊠ Claim(s) <u>1-10</u> is/are rejected.						
7) Claim(s) is/are objected to.						
8) Claim(s) are subject to restriction and/or	election requirement.					
Application Papers						
9)☐ The specification is objected to by the Examiner.						
10)⊠ The drawing(s) filed on <u>21 July 2005</u> is/are: a)⊠ accepted or b)□ objected to by the Examiner.						
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).						
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).						
11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.						
Priority under 35 U.S.C. § 119						
12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

## **DETAILED ACTION**

# Response to Arguments

1. Applicant's arguments, in the amendment filed 10/15/2008, with respect to the rejection of claims 1-10 under 35 USC 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of Kalker et al (US 2004/0250079) and Haitsma et al (US 6,477,431)

#### **Examiner Notes**

2. Examiner cites particular columns and line numbers in the references as applied to the claims below for the convenience of the applicant. Although the specified citations are representative of the teachings in the art and are applied to the specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested that, in preparing responses, the applicant fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the examiner.

# Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2624

4. Claims 1-10 are rejected under 35 U.S.C. 103 (a) as being unpatentable over Kalker et al (US 2004/0250079) in view of Haitsma et al (US 6,477,431)

As to claim 1, Kalker et al teaches the method of embedding a watermark in a motion image signal (embedding a watermark in a motion image signal, Paragraph [0001]), the method comprising the steps of:

representing said watermark by a sequence of watermark samples (The embedder further receives a watermark in the form of a pseudo-random sequence w(n) of length N, where w(n).epsilon.[-1, 1], Paragraph [0014]) each having a first or a second value (paragraph [0014-0015])); determining a global property of the first and the second image area (the method according to the invention comprises the steps of determining, for each image, a global property of the pixels constituting said image, para [008-0011])) modifying said image to increase the global property of its first area and decrease the global property of its second area for embedding the first value of a watermark sample into said image, and to decrease the global property of its first area and increase the global property of its second area for embedding the second value of said watermark sample into said image (and modifying the global property of each image of a sequence of images in accordance with the corresponding watermark sample. In a preferred embodiment, said global property is the mean luminance of an image, paragraph [0008]). While Kalker meets a number of the limitations of the claimed invention, as pointed out more fully above, Kalker fails to teach dividing an image of said motion image signal into at least a first and a second image area; . Specifically, Haitsma et al teaches The accumulated frames are subsequently partitioned (22) into blocks of size M.times.M (M=128) and all the blocks are stacked (23) in a buffer q of size M.times.M. This operation is known as folding. FIG. 5

illustrates this operation of folding. Moreover, Haitsma et al teaches the strength of the final watermark is determined by a global depth parameter d which provides a global scaling (18) of W (K, P). A large value of d corresponds to a robust but possibly visible watermark. A small value corresponds to an almost imperceptible but weak watermark. The actual choice of d will be a compromise between the robustness and perceptibility requirements. The watermarked image Q is obtained by adding (12) W=d.times.W (K, P) to P, rounding to integer pixel values and clipping to the allowed pixel value range. It would have been obvious to one of ordinary skill in the art to divide the motion signal to upper and lower halfes in order to achieve sufficient robustness and increase in copy protection. Therefore, the claimed invention would have been obvious to one of ordinary skill in the art at the time of the invention by applicant.

As to claims 2 and 3, Kalker et al in view of Haitsma et al, teaches a method as claimed in claim 1, wherein said global property is the mean luminance value of the respective image area (the method according to the invention comprises the steps of determining, for each image, a global property of the pixels constituting said image, and modifying the global property of each image of a sequence of images in accordance with the corresponding watermark sample. Note that said global property is the mean luminance of an image; paragraph [0008-0015])

As to claims 4 and 5, Kalker et al in view of Haitsma et al, teaches a method as claimed in claim 1, wherein said first and second image areas are the upper and lower of an image halves, respectively (paragraph[0018-0019])).

The limitation of claims 6-8 has been addressed above except for the following: correlating for said series of images the respective difference with the watermark to be detected Kalker et al teaches that limitation in (paragraph [0011], [0024]); see also Haitsma et al figure 5)

Application/Control Number: 10/542,837 Page 5

Art Unit: 2624

As to claims 9, Kalker et al in view of Haitsma et al, teaches a method as claimed in claim 7, further including the step of subtracting from the series of global properties a low-pass filtered version thereof, and applying the correlating step to the subtracted signal (subtractor 8, laplacian filter 4; paragraph[0021])).

As to claim 10, Kalker et al in view of Haitsma et al, teaches the method as claimed in claim 9, further including the step of determining the sign of said subtracted signal, and applying the correlating step to said sign (The contents of each buffer are cross-correlated with the reference watermark in respective correlators 231, 232, . . . The correlation is preferably performed using Symmetrical Phase Only Matched Filtering (SPOMF); paragraph [0024]).

## Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to NANCY BITAR whose telephone number is (571)270-1041. The examiner can normally be reached on Mon-Fri (7:30a.m. to 5:00pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jinge Wu can be reached on 571-272-7429. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
